

Dylan Smith Reading #1

1. `str()` will show the structure of a data frame,

2. Attaching a data frame means to add it to the R search path. You no longer need to reference the data frame by name and can reference columns directly,

3. `patient.data$diabetes`

4. `patient.data[patient.data$age <= 30, c(2, 3)]`

5. When creating an ordered factor, it is mandatory to set the levels because this tells R how to do the ordering. Otherwise, R will order alphabetically,

6. `patient.data$eye_color <- factor(patient.data$eye_color)`
