

Dylan Smith Reading #5

1. Use `pnorm()` to find the cumulative probability from a normal distribution.
2. Use `qnorm()` to find a value from a normal distribution when given a probability.
3. Use `mean = 80` and `sd = 12`
4. You can use `plot()` or `curve()` to graph the Standard Normal PDF.
5. H_0 : lakes \$ width $\sim$ Normal
 H_1 : lakes \$ width $\not\sim$ Normal
6. shapiro.test(lakes\$width)
7. Decision: Reject H_0 .
Conclusion: lakes \$ width is not normally distributed.
8. Decision: Do not reject H_0 .
Conclusion: Normality of lakes \$ width seems plausible.
